

A scatter plot showing the relationship between the 'Raw Score' (X-axis) and the 'Number of Correct Answers' (Y-axis). The X-axis ranges from 0 to 10 with major ticks every 2.5 units. The Y-axis ranges from 0 to 10 with major ticks every 2 units. The plot area has a light gray background with white grid lines. Data points are represented by black dots. There is a clear positive correlation between the two variables, with most points clustered along the diagonal line where the raw score equals the number of correct answers. Some points deviate from this line, particularly at higher scores.
