

A scatter plot showing the relationship between the number of correct answers (X-axis) and the raw score (Y-axis). The X-axis ranges from 0 to 9, and the Y-axis ranges from 0 to 10. The plot shows a positive correlation, with raw scores generally increasing as the number of correct answers increases. There are several vertical clusters of points, indicating that multiple test-takers achieved the same number of correct answers but received different raw scores. For example, at 5 correct answers, raw scores range from approximately 4.5 to 5.5. At 9 correct answers, raw scores range from approximately 8.5 to 9.5.
