

The scatter plot displays the relationship between 'Raw Score' (X-axis) and a categorical variable (Y-axis). The X-axis ranges from 0 to 15, and the Y-axis has 10 categories. Data points are represented by black dots. The plot shows a clear positive correlation, where higher raw scores generally correspond to higher categories on the Y-axis. For example, scores between 0 and 2 are clustered in the bottom two categories, while scores between 13 and 15 are clustered in the top two categories. There is some overlap between categories for intermediate scores, particularly between categories 4 and 5 for scores around 6-8.
